AI Agents Arena

Round 1 — Outbound AI Sales Caller (Problem Statement)

---

1. Project Overview

Participants must build an AI-powered outbound sales calling agent for a solar installation company. The agent acts as a professional AI sales caller: introducing the company, addressing the lead by first name, handling objections, collecting qualification data, answering frequently asked questions using the provided company details, logging all data to a Google Sheet, and sending follow-up emails based on the call outcome.

2. Company Profile (for simulation)

Company Name	SolarEase Solutions
Business Address	123 GreenTech Avenue, San Diego, CA 92101
Operating Hours	Monday–Friday, 9:00 AM – 6:00 PM (PST)
Estimated Price Range	10,000 USD – 25,000 USD (system size/site dependent)

The AI sales caller must be able to answer basic questions about the above details during the call.

3. Functional Requirements

3.1 Call Opening and Pitch

- Open professionally (for example, "Hi [First Name], how are you?").
- Give a concise pitch: lower utility bills, financing options, expert installation.

3.2 Lead Qualification (record all answers)

- Ask and capture the following:
  - Roof type/material.
  - Average monthly electricity bill (last 3 months).
  - Approximate home size (square feet).
  - Typical daytime occupancy (home during peak sun hours).
  - Number of heavy appliances (ACs, refrigerators, electric heaters, etc.).
  - Number of ceiling fans in regular use.
  - Current utility provider and peak tariff (if known).
  - Shading concerns (trees or adjacent buildings).
  - Preferred financing (cash, loan, or lease) and budget expectations.

Note: The Google Sheet must contain a separate column for each question above. Do not concatenate multiple answers in a single cell.

3.3 Objection Handling

- Respond politely to common objections:
  - Where did you get my number?
  - I am busy right now.
  - Not interested.

3.4 FAQs from Company Profile

- Answer questions about address, hours, and indicative pricing.

3.5 Data Logging and Outcomes

- Log all captured data to a Google Sheet (Google Sheets is the only approved data store).
- Set the final outcome status:
  - Interested
  - Not Interested
  - Callback Requested (with preferred time)
  - No Response/Hang-up

3.6 Follow-up Email Automation

- Trigger an immediate email based on the outcome:
  - Hang-up / No Response: We Tried Reaching You - SolarEase Solutions (note that an attempt was made; invite reply to the email to reconnect).
  - Not Interested: Thank You for Your Time - SolarEase Solutions (thank the lead; state they can reach out in the future if needs change).
  - Interested: Thanks for Your Interest - Next Steps with SolarEase (summarize next steps; restate preferred time if provided).

4. Expected Deliverables

- Working outbound call workflow for the AI sales caller.
- Google Sheet entries that show captured data in separate columns and final outcomes.
- Three follow-up emails generated by the automation (hang-up/no response, not interested, interested).

5. Evaluation Criteria

- Naturalness and professionalism of the call flow.
- Completeness and accuracy of qualification data capture.
- Correctness of outcome setting and email triggering logic.
- Clarity and organization of logged records in Google Sheets.
- Practicality and robustness of the overall solution.
